Classifier Example

| Rule | Network-Layer | | Transport-Layer | | Application-Layer | |
|-------|---------------|--------------|-----------------|-------------|-------------------|-----------------------------------|
| | Destination | Source | Protocol | Destination | Protocol | Action |
| R_1 | 128.238/16 | * | TCP | = telnet | * | Deny |
| R_2 | 176.110/16 | 196.27.43/24 | UDP | * | RTP | Send to port III |
| R_3 | 196.27.43/24 | 134.65/16 | TCP | * | * | Drop traffic if rate > 10 Mbps |
| R_4 | * | * | * | * | * | Permit |

- **Packet Filtering.** Rule R_1 blocks all telnet connections from outside into Net A, which may be a private research network.
- **Policy Routing.** Rule R_2 enables the router to forward all real-time traffic using real-time transport protocol (RTP) in the application layer from Net B to Net D through the ATM network at the bottom of previous Figure.
- **Traffic Policing.** Rule R_3 limits the total transmission control protocol (TCP) traffic rate from Net C to Net B up to 10 Mbps

Packet Classification

Matching the packet header to the rules in the classifier

Packet classification

1. A classifier C consists of N rules, R_j , $1 \leq j \leq N$, where R_j is composed of three entities:
 - (a) A regular expression $R_j[i]$, $1 \leq i \leq d$, on each of the d header fields of a packet.
 - (b) A number, $Pri(R_j)$, indicating the priority of the rule in the classifier.
 - (c) An action, referred to as $Action(R_j)$.
2. An incoming packet P with the header considered as a d -tuple (P_1, P_2, \dots, P_d) is said to match R_j , if and only if, P_i matches $R_j[i]$, where $1 \leq i \leq d$.
3. Given an incoming packet P and thus the d -tuple, the d -dimensional packet classification problem is to find the rule R_m with the highest priority among all the rules R_j matching the d -tuple.

Example Classifier

| Rule | F_1 | F_2 | F_3 | F_4 | Action |
|-------|-------|-------|--------|----------|---------|
| R_1 | 00* | 110* | 6 | (10, 12) | Act_0 |
| R_2 | 00* | 11* | (4, 8) | 15 | Act_1 |
| R_3 | 10* | 1* | 7 | 9 | Act_2 |
| R_4 | 0* | 01* | 10 | (10, 12) | Act_1 |
| R_5 | 0* | 10* | (4, 8) | 15 | Act_0 |
| R_6 | 0* | 1* | 10 | (10, 12) | Act_3 |
| R_7 | * | 00* | 7 | 15 | Act_1 |

Performance Metrics

- Search Speed,
- Storage Requirement,
- Scalability in Classifier Size,
- Scalability in the Number of Header Fields,
- Update Time,
- Flexibility in Specification.

Recursive Flow Classification

Chopping of packet header into chunks for rule set C in the first phase of RFC.

Example of computing the four equivalence classes $E_0 \dots E_3$ for chunk 2 (corresponding to the 16-bit transport-layer destination port number) in the rule set of the classifier.

Rule storing organization for RFC for the rule set in the classifier table.
